

Scan Report

October 16, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Metasploitable2 day 3”. The scan started at Thu Oct 16 08:30:39 2025 UTC and ended at Thu Oct 16 09:03:15 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1	Result Overview	2
1.1	Host Authentications	2
2	Results per Host	2
2.1	192.168.222.129	2
2.1.1	High 5432/tcp	3
2.1.2	High 3306/tcp	6
2.1.3	High 1099/tcp	7
2.1.4	High 21/tcp	9
2.1.5	High 5900/tcp	11
2.1.6	High general/tcp	11
2.1.7	High 512/tcp	12
2.1.8	High 514/tcp	13
2.1.9	High 80/tcp	14
2.1.10	High 1524/tcp	18
2.1.11	High 8009/tcp	19
2.1.12	High 513/tcp	25
2.1.13	High 2121/tcp	27
2.1.14	High 8787/tcp	28
2.1.15	High 3632/tcp	29
2.1.16	Medium 445/tcp	30
2.1.17	Medium 22/tcp	32

2.1.18	Medium 5432/tcp	36
2.1.19	Medium 21/tcp	53
2.1.20	Medium 25/tcp	55
2.1.21	Medium 5900/tcp	74
2.1.22	Medium 80/tcp	75
2.1.23	Medium 2121/tcp	89
2.1.24	Medium 23/tcp	90
2.1.25	Low 22/tcp	90
2.1.26	Low 5432/tcp	92
2.1.27	Low general/icmp	95
2.1.28	Low 25/tcp	96
2.1.29	Low general/tcp	102

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.222.129	19	40	6	0	0
Total: 1	19	40	6	0	0

Vendor security updates are not trusted.

Overrides are off. Even when a result has an override, this report uses the actual threat of the result.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 65 results selected by the filtering described above. Before filtering there were 623 results.

1.1 Host Authentications

2.1.1 High 5432/tcp

High (CVSS: 9.0)
NVT: PostgreSQL Default Credentials (PostgreSQL Protocol)
Product detection result cpe:/a:postgresql:postgresql:8.3.1 Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802 ↪5)
Summary It was possible to login into the remote PostgreSQL as user postgres using weak credentials.
Quality of Detection (QoD): 99%
Vulnerability Detection Result It was possible to login as user postgres with password "postgres".
Solution: Solution type: Mitigation Change the password as soon as possible.
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Method Details: PostgreSQL Default Credentials (PostgreSQL Protocol) OID:1.3.6.1.4.1.25623.1.0.103552 Version used: 2024-07-19T15:39:06Z
Product Detection Result Product: cpe:/a:postgresql:postgresql:8.3.1 Method: PostgreSQL Detection Consolidation OID: 1.3.6.1.4.1.25623.1.0.128025)

High (CVSS: 7.4)
NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability
Summary OpenSSL is prone to a security bypass vulnerability.
Quality of Detection (QoD): 70%
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.
Solution: Solution type: VendorFix Updates are available. Please see the references for more information.
Affected Software/OS OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.
Vulnerability Insight OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.
Vulnerability Detection Method Send two SSL ChangeCipherSpec request and check the response. Details: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability OID:1.3.6.1.4.1.25623.1.0.105042

2.1.2 High 3306/tcp

High (CVSS: 9.8)

NVT: MySQL / MariaDB Default Credentials (MySQL Protocol)

Product detection result

cpe:/a:mysql:mysql:5.0.51a

Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.↵25623.1.0.100152)

Summary

It was possible to login into the remote MySQL using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

It was possible to login as user "root" with an empty password.

Solution:

Solution type: Mitigation

- Change the password as soon as possible
- Contact the vendor for other possible fixes / updates

Affected Software/OS

The following products are known to use such weak credentials:

- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x
- CVE-2002-1809: Windows binary release of MySQL 3.23.2 through 3.23.52
- CVE-2004-1532: AppServ 2.5.x and earlier
- CVE-2004-2357: Proofpoint Protection Server
- CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6
- CVE-2007-2554: Associated Press (AP) Newpower 4.0.1 and earlier

[\[return to 192.168.222.129 \]](#)

2.1.3 High 1099/tcp

High (CVSS: 7.5)
NVT: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check
Summary
... continues on next page ...

...continued from previous page ...	
Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code (remote code execution/RCE) on a targeted system with elevated privileges.	
Quality of Detection (QoD): 95%	
Vulnerability Detection Result By doing an RMI request it was possible to trigger the vulnerability and make the remote host sending a request back to the scanner host (Details on the received packet follows). Destination IP: 192.168.222.128 (receiving IP on scanner host side) Destination port: 10213/tcp (receiving port on scanner host side) Originating IP: 192.168.222.129 (originating IP from target host side)	
Impact An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.	
Solution: Solution type: Workaround Disable class-loading. Please contact the vendor of the affected system for additional guidance.	
Vulnerability Insight The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.	
Vulnerability Detection Method Sends a crafted JRMI request and checks if the target is connecting back to the scanner host. Note: For a successful detection of this flaw the target host needs to be able to reach the scanner host on a TCP port randomly generated during the runtime of the VT (currently in the range of 10000-32000). Details: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check OID:1.3.6.1.4.1.25623.1.0.140051 Version used: 2025-04-11T15:45:04Z

2.1.4 High 21/tcp

High (CVSS: 7.5)

NVT: FTP Brute Force Logins With Default Credentials Reporting

Summary

It was possible to login into the remote FTP server using weak/known credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

It was possible to login with the following credentials <User>:<Password>

```

msfadmin:msfadmin
postgres:postgres
service:service
user:user

```

Impact

... continues on next page ...

...continued from previous page ...
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.
Solution: Solution type: Mitigation Change the password as soon as possible.
Vulnerability Insight The following devices are / software is known to be affected: - CVE-2001-1594: Codonics printer FTP service as used in GE Healthcare eNTEGRA P&R - CVE-2013-7404: GE Healthcare Discovery NM 750b - CVE-2014-9198: Schneider Electric ETG3000 FactoryCast HMI gateways - CVE-2015-7261: QNAP iArtist Lite distributed with QNAP Signage Station - CVE-2016-8731: Foscam C1 devices - CVE-2017-8218: vsftpd on TP-Link C2 and C20i devices - CVE-2018-9068: IMM2 for IBM and Lenovo System x - CVE-2018-17771: Ingenico Telium 2 PoS terminals - CVE-2018-19063, CVE-2018-19064: Foscam C2 and Opticam i5 devices Note: As the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.
Vulnerability Detection Method Reports weak/known credentials detected by the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717). Details: FTP Brute Force Logins With Default Credentials Reporting OID:1.3.6.1.4.1.25623.1.0.108718 Version used: 2025-05-13T05:41:39Z

2.1.5 High 5900/tcp

High (CVSS: 9.0) NVT: VNC Brute Force Login
Summary Try to log in with given passwords via VNC protocol.
Quality of Detection (QoD): 95%
Vulnerability Detection Result It was possible to connect to the VNC server with the password: password
Solution: Solution type: Mitigation Change the password to something hard to guess or enable password protection at all.
Vulnerability Insight This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all. Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked. Note as well that passwords can be max. 8 characters long.
Vulnerability Detection Method Details: VNC Brute Force Login OID:1.3.6.1.4.1.25623.1.0.106056 Version used: 2021-07-23T07:56:26Z

[\[return to 192.168.222.129 \]](#)

2.1.6 High general/tcp

High (CVSS: 10.0) NVT: Operating System (OS) End of Life (EOL) Detection
Product detection result cpe:/o:canonical:ubuntu_linux:8.04 Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0 ↪.105937)
... continues on next page ...

...continued from previous page ...
Summary The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The "Ubuntu" Operating System on the remote host has reached the end of life. CPE: <code>cpe:/o:canonical:ubuntu_linux:8.04</code> Installed version, build or SP: 8.04 EOL date: 2013-05-09 EOL info: https://wiki.ubuntu.com/Releases
Impact An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.
Solution: Solution type: Mitigation Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor. Note / Important: Please create an override for this result if the target host is a: - Windows system with Extended Security Updates (ESU) - System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar
Vulnerability Detection Method Checks if an EOL version of an OS is present on the target host. Details: Operating System (OS) End of Life (EOL) Detection OID:1.3.6.1.4.1.25623.1.0.103674 Version used: 2025-05-21T05:40:19Z
Product Detection Result Product: <code>cpe:/o:canonical:ubuntu_linux:8.04</code> Method: OS Detection Consolidation and Reporting OID: 1.3.6.1.4.1.25623.1.0.105937)

[\[return to 192.168.222.129 \]](#)

2.1.7 High 512/tcp

High (CVSS: 10.0) NVT: The rexec service is running
Summary This remote host is running a rexec service.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The rexec service was detected on the target system.
Solution: Solution type: Mitigation Disable the rexec service and use alternatives like SSH instead.
Vulnerability Insight rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer. The main difference is that rexec authenticates by reading the username and password *unencrypted* from the socket.
Vulnerability Detection Method Checks whether an rexec service is exposed on the target host. Details: The rexec service is running OID:1.3.6.1.4.1.25623.1.0.100111 Version used: 2023-09-12T05:05:19Z
References cve: CVE-1999-0618

[\[return to 192.168.222.129 \]](#)

2.1.8 High 514/tcp

High (CVSS: 7.5) NVT: rsh Unencrypted Cleartext Login
Summary This remote host is running a rsh service.
Quality of Detection (QoD): 80%
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result The rsh service is misconfigured so it is allowing connections without a password or with default root:root credentials.
Solution: Solution type: Mitigation Disable the rsh service and use alternatives like SSH instead.
Vulnerability Insight rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.
Vulnerability Detection Method Details: rsh Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.100080 Version used: 2021-10-20T09:03:29Z

2.1.9 High 80/tcp

High (CVSS: 10.0)
NVT: TWiki XSS and Command Execution Vulnerabilities
Summary TWiki is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.2.4
Impact Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.
... continues on next page ...

...continued from previous page ...
Solution: Solution type: VendorFix Upgrade to version 4.2.4 or later.
Affected Software/OS TWiki, TWiki version prior to 4.2.4.
Vulnerability Insight The flaws are due to: - %URLPARAM}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack. - %SEARCH}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.
Vulnerability Detection Method Details: TWiki XSS and Command Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800320 Version used: 2024-03-01T14:37:10Z

High (CVSS: 9.8)
NVT: PHP < 5.3.13, 5.4.x < 5.4.3 Multiple Vulnerabilities - Active Check
Summary PHP is prone to multiple vulnerabilities.
Quality of Detection (QoD): 95%
Vulnerability Detection Result By doing the following HTTP POST request: "HTTP POST" body : <?php phpinfo();?> URL : http://192.168.222.129/cgi-bin/php?%2D%64+%61%6C%6C%6F%77%5F% ↪75%72%6C%5F%69%6E%63%6C%75%64%65%3D%6F%6E+%2D%64+%73%61%66%65%5F%6D%6F%64%65%3 ↪D%6F%66%66+%2D%64+%73%75%68%6F%73%69%6E%2E%73%69%6D%75%6C%61%74%69%6F%6E%3D%6F ↪%6E+%2D%64+%64%69%73%61%62%6C%65%5F%66%75%6E%63%74%69%6F%6E%73%3D%22%22+%2D%64 ↪+%6F%70%65%6E%5F%62%61%73%65%64%69%72%3D%6E%6F%6E%65+%2D%64+%61%75%74%6F%5F%70 ↪%72%65%70%65%6E%64%5F%66%69%6C%65%3D%70%68%70%3A%2F%2F%69%6E%70%75%74+%2D%64+% ... continues on next page ...

<p>...continued from previous page ...</p> <pre> ↵63%67%69%2E%66%6F%72%63%65%5F%72%65%64%69%72%65%63%74%3D%30+%2D%64+%63%67%69%2 ↵E%72%65%64%69%72%65%63%74%5F%73%74%61%74%75%73%5F%65%6E%76%3D%30+%2D%6E it was possible to execute the "<?php phpinfo();?>" command. Result: <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV ↵E" /></head> <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph ↵p5/cgi </td></tr> <h2>PHP Variables</h2> </pre>
<p>Impact</p> <p>Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.</p>
<p>Solution:</p> <p>Solution type: VendorFix</p> <p>PHP: Update to version 5.3.13, 5.4.3 or later</p> <p>- Other products / applications: Please contact the vendor for a solution</p>
<p>Affected Software/OS</p> <p>PHP versions prior to 5.3.13 and 5.4.x prior to 5.4.3.</p> <p>Other products / applications might be affected by the tested CVE-2012-1823 as well.</p>
<p>Vulnerability Insight</p> <p>When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.</p> <p>An example of the -s command, allowing an attacker to view the source code of index.php is below:</p> <p>http://example.com/index.php?-s</p>
<p>Vulnerability Detection Method</p> <p>Send multiple a crafted HTTP POST requests and checks the responses.</p> <p>Note: This script checks for the presence of CVE-2012-1823 which indicates that the system is also affected by the other included CVEs.</p> <p>Details: PHP < 5.3.13, 5.4.x < 5.4.3 Multiple Vulnerabilities - Active Check</p> <p>OID:1.3.6.1.4.1.25623.1.0.103482</p> <p>Version used: 2025-04-24T05:40:00Z</p>
<p>References</p> <p>cve: CVE-2012-1823</p> <p>cve: CVE-2012-2311</p> <p>cve: CVE-2012-2336</p> <p>cve: CVE-2012-2335</p>

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

Summary

Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

We could upload the following files via the PUT method at this web server:

<http://192.168.222.129/dav/puttest1379024686.html>

We could delete the following files via the DELETE method at this web server:

...continues on next page ...

...continued from previous page ...
http://192.168.222.129/dav/puttest1379024686.html
Impact - Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server. - Enabled DELETE method: This might allow an attacker to delete additional files on this web server.
Solution: Solution type: Mitigation Use access restrictions to these dangerous HTTP methods or disable them completely.
Affected Software/OS Web servers with enabled PUT and/or DELETE methods.
Vulnerability Detection Method Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files. Details: Test HTTP dangerous methods OID:1.3.6.1.4.1.25623.1.0.10498 Version used: 2023-08-01T13:29:10Z

2.1.12 High 513/tcp

High (CVSS: 10.0)
NVT: rlogin Passwordless Login
Summary The rlogin service allows root access without a password.
Quality of Detection (QoD): 80%
... continues on next page ...

...continued from previous page ...	
Vulnerability Detection Result	It was possible to gain root access without a password.
Impact	This vulnerability allows an attacker to gain complete control over the target system.
Solution: Solution type: Mitigation	Disable the rlogin service and use alternatives like SSH instead.
Vulnerability Detection Method	Checks if a vulnerable version is present on the target host. Details: rlogin Passwordless Login OID:1.3.6.1.4.1.25623.1.0.113766 Version used: 2020-09-30T09:30:12Z

High (CVSS: 7.5)	
NVT: The rlogin service is running	
Summary	This remote host is running a rlogin service.
Quality of Detection (QoD): 80%	
Vulnerability Detection Result	The rlogin service is running on the target system.
Solution: Solution type: Mitigation	Disable the rlogin service and use alternatives like SSH instead.
Vulnerability Insight	rlogin has several serious security problems, - all information, including passwords, is transmitted unencrypted. - .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)
Vulnerability Detection Method	Details: The rlogin service is running OID:1.3.6.1.4.1.25623.1.0.901202 Version used: 2025-03-05T05:38:53Z

2.1.14 High 8787/tcp

High (CVSS: 10.0) NVT: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities
Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The service is running in \$SAFE >= 1 mode. However it is still possible to run a ↵rbbitrary syscall commands on the remote host. Sending an invalid syscall the s ↵ervice returned the following response: Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'syscall'"0/usr/lib/ ↵ruby/1.8/drb/drb.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in '__se ↵nd__'"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'perform_without_block'"3/usr/lib/ ↵ruby/1.8/drb/drb.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in 'm ↵ain_loop'"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drb/ ↵drb.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in 'start'"5/usr ↵/lib/ruby/1.8/drb/drb.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drb/drb.rb:143 ... continues on next page ...

...continued from previous page ... ↪0:in 'run'"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in 'start'"/usr/lib/ruby/1.8/dr ↪b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/us ↪r/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in ↪'start_service'"/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im ↪plemented
Impact By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.
Solution: Solution type: Mitigation Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include: - Implementing taint on untrusted input - Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate) - Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts
Vulnerability Detection Method Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests. Details: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.108010 Version used: 2024-06-28T05:05:33Z

2.1.15 High 3632/tcp

High (CVSS: 9.3)
NVT: DistCC RCE Vulnerability (CVE-2004-2687)
... continues on next page ...

...continued from previous page ...
Summary DistCC is prone to a remote code execution (RCE) vulnerability.
Quality of Detection (QoD): 99%
Vulnerability Detection Result It was possible to execute the "id" command. Result: uid=1(daemon) gid=1(daemon)
Impact DistCC by default trusts its clients completely that in turn could allow a malicious client to execute arbitrary commands on the server.
Solution: Solution type: VendorFix Vendor updates are available. Please see the references for more information. For more information about DistCC's security see the references.
Vulnerability Insight DistCC 2.x, as used in XCode 1.5 and others, when not configured to restrict access to the server port, allows remote attackers to execute arbitrary commands via compilation jobs, which are executed by the server without authorization checks.
Vulnerability Detection Method Details: DistCC RCE Vulnerability (CVE-2004-2687) OID:1.3.6.1.4.1.25623.1.0.103553 Version used: 2022-07-07T10:16:06Z

Product detection result

`cpe:/a:ietf:secure_shell_protocol`
 Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
 ↪)

Summary

The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

The remote SSH server supports the following weak KEX algorithm(s):

KEX algorithm	Reason

↪-----	
diffie-hellman-group-exchange-sha1	Using SHA-1
diffie-hellman-group1-sha1	Using Oakley Group 2 (a 1024-bit MODP group ↪) and SHA-1

Impact

An attacker can quickly break individual connections.

Solution:

Solution type: Mitigation

Disable the reported weak KEX algorithm(s)

- 1024-bit MODP group / prime KEX algorithms:

Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

... continues on next page ...

...continued from previous page ...	
Vulnerability Insight - 1024-bit MODP group / prime KEX algorithms: Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime. A nation-state can break a 1024-bit prime.	
Vulnerability Detection Method Checks the supported KEX algorithms of the remote SSH server. Currently weak KEX algorithms are defined as the following: - non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime - ephemeraly generated key exchange groups uses SHA-1 - using RSA 1024-bit modulus key Details: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH) OID:1.3.6.1.4.1.25623.1.0.150713 Version used: 2024-06-14T05:05:48Z

Summary The remote SSH server is configured to allow / support weak encryption algorithm(s).	
Quality of Detection (QoD): 80%	
... continues on next page ...	

...continued from previous page...

Vulnerability Detection Result

The remote SSH server supports the following weak client-to-server encryption algorithms(s):

3des-cbc

aes128-cbc

aes192-cbc

aes256-cbc

arcfour

arcfour128

arcfour256

blowfish-cbc

cast128-cbc

rijndael-cbc@lysator.liu.se

The remote SSH server supports the following weak server-to-client encryption algorithms(s):

3des-cbc

aes128-cbc

aes192-cbc

aes256-cbc

arcfour

arcfour128

arcfour256

blowfish-cbc

cast128-cbc

rijndael-cbc@lysator.liu.se

Solution:

Solution type: Mitigation

Disable the reported weak encryption algorithm(s).

Vulnerability Insight

- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method

Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.

Currently weak encryption algorithms are defined as the following:

- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms

[\[return to 192.168.222.129 \]](#)

2.1.18 Medium 5432/tcp

Medium (CVSS: 5.9) NVT: SSL/TLS: Report Weak Cipher Suites
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↵802067)
Summary This routine reports all weak SSL/TLS cipher suites accepted by a service.
Quality of Detection (QoD): 98%
Vulnerability Detection Result 'Weak' cipher suites accepted by this service via the SSLv3 protocol: TLS_RSA_WITH_RC4_128_SHA 'Weak' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_RSA_WITH_RC4_128_SHA
Impact This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.
Solution:
... continues on next page ...

...continued from previous page ...	
Solution type: Mitigation	
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore. Please see the references for more resources supporting you with this task.	
Affected Software/OS	
All services providing an encrypted communication using weak SSL/TLS cipher suites.	
Vulnerability Insight	
These rules are applied for the evaluation of the cryptographic strength: - RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808) - Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000) - 1024 bit RSA authentication is considered to be insecure and therefore as weak - Any cipher considered to be secure for only the next 10 years is considered as medium - Any other cipher is considered as strong	
Vulnerability Detection Method	
Checks previous collected cipher suites. NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication. Details: SSL/TLS: Report Weak Cipher Suites OID:1.3.6.1.4.1.25623.1.0.103440 Version used: 2025-03-27T05:38:50Z	
Product Detection Result

Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020 &67) VT.

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.

Please see the references for more resources supporting you with this task.

Affected Software/OS

All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight

The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:

- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

... continues on next page ...

...continued from previous page ...

Vulnerability Detection Method

Checks the used SSL protocols of the services provided by this system.

Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Medium (CVSS: 5.3)
NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits
Summary The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The remote SSL/TLS server is using the following certificate(s) with a RSA key with less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer): 1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thing outside US,C=XX (Server certificate)
Impact Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.
Solution: Solution type: Mitigation Replace the certificate with a stronger key and reissue the certificates it signed.
Vulnerability Insight SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.
Vulnerability Detection Method Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit. Details: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048. ↳.. OID:1.3.6.1.4.1.25623.1.0.150710 Version used: 2021-12-10T12:48:00Z

NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)

Summary

The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 70%**Vulnerability Detection Result**

The following indicates that the remote SSL/TLS service is affected:

Protocol Version | Successful re-done SSL/TLS handshakes (Renegotiation) over an
 ↪ existing / already established SSL/TLS connection

 ↪-----

TLSv1.0 | 10

Impact

The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.

Solution:**Solution type:** VendorFix

Users should contact their vendors for specific patch information.

A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.

Affected Software/OS

Every SSL/TLS service which does not properly restrict client-initiated renegotiation.

Vulnerability Insight

The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.

Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:

> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.

Both CVEs are still kept in this VT as a reference to the origin of this flaw.

↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm: sha1WithRSAEncryption

```

Solution:**Solution type:** Mitigation

... continues on next page ...

...continued from previous page ...
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.
<p>Vulnerability Insight</p> <p>The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:</p> <ul style="list-style-type: none"> - Secure Hash Algorithm 1 (SHA-1) - Message Digest 5 (MD5) - Message Digest 4 (MD4) - Message Digest 2 (MD2) <p>Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.</p> <p>NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:</p> <p>Fingerprint1 or fingerprint1, Fingerprint2</p>
<p>Vulnerability Detection Method</p> <p>Check which hashing algorithm was used to sign the remote SSL/TLS certificate.</p> <p>Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm</p> <p>OID:1.3.6.1.4.1.25623.1.0.105880</p> <p>Version used: 2021-10-15T11:13:32Z</p>

Medium (CVSS: 4.0)
NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
<p>Summary</p> <p>The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).</p>
Quality of Detection (QoD): 80%
<p>Vulnerability Detection Result</p> <p>Server Temporary Key Size: 1024 bits</p>
<p>Impact</p> <p>... continues on next page ...</p>

...continued from previous page...	
An attacker might be able to decrypt the SSL/TLS communication offline.	
Solution: Solution type: Workaround - Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task. - For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.	
Affected Software/OS All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.	
Vulnerability Insight The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.	
Vulnerability Detection Method Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↪.. OID:1.3.6.1.4.1.25623.1.0.106223 Version used: 2025-03-27T05:38:50Z

2.1.19 Medium 21/tcp

Medium (CVSS: 6.4)
NVT: Anonymous FTP Login Reporting
Summary Reports if the remote FTP Server allows anonymous logins.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was possible to login to the remote FTP service with the following anonymous ↪account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
Impact Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
Solution: Solution type: Mitigation If you do not want to share files, you should disable anonymous logins.
Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.
Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: 2021-10-20T09:03:29Z
References cve: CVE-1999-0497

Medium (CVSS: 4.8)
NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↔. Response(s): Non-anonymous sessions: 331 Please specify the password. Anonymous sessions: 331 Please specify the password.
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution: Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
Vulnerability Detection Method Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command. Details: FTP Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.108528 Version used: 2023-12-20T05:05:58Z

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Product detection result

cpe:/a:ietf:transport_layer_security:1.0

Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)

Summary

... continues on next page ...

...continued from previous page ...
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.
Quality of Detection (QoD): 98%
Vulnerability Detection Result In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and SSLv3 protocols and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
Impact An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection. Furthermore newly uncovered vulnerabilities in these protocols won't receive security updates anymore.
Solution: Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.
Vulnerability Insight The SSLv2 and SSLv3 protocols contain known cryptographic flaws like: - CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE) - CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)
Vulnerability Detection Method Checks the used SSL protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID:1.3.6.1.4.1.25623.1.0.111012 Version used: 2025-03-27T05:38:50Z

Medium (CVSS: 5.0)
NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)
Summary The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The following indicates that the remote SSL/TLS service is affected: Protocol Version Successful re-done SSL/TLS handshakes (Renegotiation) over an ↔ existing / already established SSL/TLS connection ----- ↔----- TLSv1.0 10
Impact The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.
... continues on next page ...

...continued from previous page ...	
Solution:	
Solution type: VendorFix	
Users should contact their vendors for specific patch information. A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.	
Affected Software/OS	
Every SSL/TLS service which does not properly restrict client-initiated renegotiation.	
Vulnerability Insight	
The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols. Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale: > It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment. Both CVEs are still kept in this VT as a reference to the origin of this flaw.	
Vulnerability Detection Method	
Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection. Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094) OID:1.3.6.1.4.1.25623.1.0.117761 Version used: 2024-09-27T05:05:23Z	
References

dfn-cert: DFN-CERT-2012-1112

Medium (CVSS: 5.0)

NVT: Check if Mailserver answer to VRFY and EXPN requests

Summary

The Mailserver on this host answers to VRFY and/or EXPN requests.

Quality of Detection (QoD): 99%**Vulnerability Detection Result**

'VRFY root' produces the following answer: 252 2.0.0 root

Solution:**Solution type:** Workaround

Disable VRFY and/or EXPN on your Mailserver.

For postfix add 'disable_vrfy_command=yes' in 'main.cf'.

For Sendmail add the option 'O PrivacyOptions=goaway'.

It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.

Vulnerability Insight

VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.

Vulnerability Detection Method

Details: Check if Mailserver answer to VRFY and EXPN requests

OID:1.3.6.1.4.1.25623.1.0.100072

Version used: 2023-10-31T05:06:37Z

Referencesurl: <http://cr.yp.to/smtp/vrfy.html>

Medium (CVSS: 5.0)

NVT: SSL/TLS: Certificate Expired

Product detection result

cpe:/a:ietf:transport_layer_security

Detected by SSL/TLS: Collect and Report Certificate Details (OID: 1.3.6.1.4.1.25623.1.0.103692)

Summary The remote server's SSL/TLS certificate has already expired.	
Quality of Detection (QoD): 99%	
Vulnerability Detection Result The certificate of the remote service expired on 2010-04-16 14:07:45. Certificate details: fingerprint (SHA-1) ED093088706603BFD5DC237399B498DA2D4D31C6 fingerprint (SHA-256) E7A7FA0D63E457C7C4A59B38B70849C6A70BDA6F830C7A ↪ F1E32DEE436DE813CC issued by 1.2.840.113549.1.9.1=#726F6F74407562756E747538 ↪ 30342D626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office ↪ for Complication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is ↪ no such thing outside US,C=XX public key algorithm RSA public key size (bits) 1024 serial 00FAF93A4C7FB6B9CC signature algorithm sha1WithRSAEncryption subject 1.2.840.113549.1.9.1=#726F6F74407562756E747538 ↪ 30342D626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office ↪ for Complication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is ↪ no such thing outside US,C=XX subject alternative names (SAN) None valid from 2010-03-17 14:07:45 UTC valid until 2010-04-16 14:07:45 UTC	
Solution: Solution type: Mitigation Replace the SSL/TLS certificate by a new one.	
Vulnerability Insight This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.	
Vulnerability Detection Method Details: SSL/TLS: Certificate Expired OID: 1.3.6.1.4.1.25623.1.0.103955 Version used: 2024-06-14T05:05:48Z	
Product Detection Result Product: cpe:/a:ietf:transport_layer_security Method: SSL/TLS: Collect and Report Certificate Details OID: 1.3.6.1.4.1.25623.1.0.103692)	

Medium (CVSS: 4.3)
NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↪802067)
Summary This host is accepting 'RSA_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result 'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5 'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution: Solution type: VendorFix - Remove support for 'RSA_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task. - If the service is using OpenSSL: Update to version 0.9.8zd, 1.0.0p, 1.0.1k or later.
Affected Software/OS - Hosts accepting 'RSA_EXPORT' cipher suites. - OpenSSL versions prior to 0.9.8zd, 1.0.0 prior to 1.0.0p and 1.0.1 prior to 1.0.1k.
Vulnerability Insight ... continues on next page ...

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary

The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

The following certificates are part of the certificate chain but using insecure
 ↪signature algorithms:

```

Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm: sha1WithRSAEncryption

```

Solution:**Solution type:** Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
<p>Summary</p> <p>The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).</p>
Quality of Detection (QoD): 80%
<p>Vulnerability Detection Result</p> <p>Server Temporary Key Size: 1024 bits</p>
<p>Impact</p> <p>An attacker might be able to decrypt the SSL/TLS communication offline.</p>
<p>Solution:</p> <p>Solution type: Workaround</p>
... continues on next page ...

...continued from previous page...	
<ul style="list-style-type: none"> - Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task. - For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits. 	
Affected Software/OS All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.	
Vulnerability Insight The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.	
Vulnerability Detection Method Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↔.. OID:1.3.6.1.4.1.25623.1.0.106223 Version used: 2025-03-27T05:38:50Z

2.1.21 Medium 5900/tcp

Medium (CVSS: 4.8)
NVT: VNC Server Unencrypted Data Transmission
Summary The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The VNC server provides the following insecure or cryptographically weak Security Type(s): 2 (VNC authentication)
Impact An attacker can uncover sensitive data by sniffing traffic to the VNC server.
Solution: Solution type: Mitigation Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.
Vulnerability Detection Method Details: VNC Server Unencrypted Data Transmission OID:1.3.6.1.4.1.25623.1.0.108529 Version used: 2023-07-12T05:05:04Z

Medium (CVSS: 6.1) NVT: jQuery < 1.9.0 XSS Vulnerability
Summary jQuery is prone to a cross-site scripting (XSS) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Installed version: 1.3.2 Fixed version: 1.9.0 Installation
... continues on next page ...

...continued from previous page...	
path / port:	/mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):	
- Identified file: http://192.168.222.129/mutillidae/javascript/ddsmoothmenu/jquery.min.js	
- Referenced at: http://192.168.222.129/mutillidae/	
Solution:	
Solution type: VendorFix	
Update to version 1.9.0 or later.	
Affected Software/OS	
jQuery prior to version 1.9.0.	
Vulnerability Insight	
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.	
Vulnerability Detection Method	
Checks if a vulnerable version is present on the target host.	
Details: jQuery < 1.9.0 XSS Vulnerability	
OID:1.3.6.1.4.1.25623.1.0.141636

Medium (CVSS: 5.8)
NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled
Summary The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The web server has the following HTTP methods enabled: TRACE
Impact An attacker may use this flaw to trick your legitimate web users to give him their credentials.
Solution: Solution type: Mitigation Disable the TRACE and TRACK methods in your web server configuration. Please see the manual of your web server or the references for more information.
Affected Software/OS ... continues on next page ...

...continued from previous page...

Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight

It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method

Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.

Details: HTTP Debugging Methods (TRACE/TRACK) Enabled

NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Summary

phpMyAdmin is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 99%**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Solution:**Solution type:** WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

phpMyAdmin version 3.3.8.1 and prior.

Vulnerability Insight

... continues on next page ...

...continued from previous page ...
The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

2.1.23 Medium 2121/tcp

Medium (CVSS: 4.8)
NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↩. Response(s): Non-anonymous sessions: 331 Password required for openvasvt Anonymous sessions: 331 Password required for anonymous
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution: Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
... continues on next page ...

...continued from previous page ...

Vulnerability Detection Method

Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.

Details: FTP Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.108528

2.1.24 Medium 23/tcp

Medium (CVSS: 4.8)

NVT: Telnet Unencrypted Cleartext Login

Summary

The remote host is running a Telnet service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

Solution:

Solution type: Mitigation

Replace Telnet with a protocol like SSH which supports encrypted connections.

Vulnerability Detection Method

Details: Telnet Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.108522

2.1.25 Low 22/tcp

Low (CVSS: 2.6)
NVT: Weak MAC Algorithm(s) Supported (SSH)
Product detection result cpe:/a:ietf:secure_shell_protocol Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565 ↔)
Summary The remote SSH server is configured to allow / support weak MAC algorithm(s).
Quality of Detection (QoD): 80%
Vulnerability Detection Result The remote SSH server supports the following weak client-to-server MAC algorithm ↔(s): hmac-md5 hmac-md5-96 hmac-sha1-96 umac-64@openssh.com The remote SSH server supports the following weak server-to-client MAC algorithm ↔(s): hmac-md5 hmac-md5-96 hmac-sha1-96 umac-64@openssh.com
Solution: Solution type: Mitigation Disable the reported weak MAC algorithm(s).
Vulnerability Detection Method Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server. Currently weak MAC algorithms are defined as the following: - MD5 based algorithms - 96-bit based algorithms - 64-bit based algorithms - 'none' algorithm Details: Weak MAC Algorithm(s) Supported (SSH) OID:1.3.6.1.4.1.25623.1.0.105610 Version used: 2024-06-14T05:05:48Z

2.1.27 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

The following response / ICMP packet has been received:

- ICMP Type: 14
- ICMP Code: 0

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:

Solution type: Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.

Details: ICMP Timestamp Reply Information Disclosure

2.1.28 Low 25/tcp

Low (CVSS: 3.7)
NVT: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↪802067)
Summary This host is accepting 'DHE_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result 'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5 'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
... continues on next page ...

...continued from previous page ...
Solution: Solution type: VendorFix - Remove support for 'DHE_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task. - If the service is using OpenSSL: Update to version 1.0.1n, 1.0.2b or later.
Affected Software/OS - Hosts accepting 'DHE_EXPORT' cipher suites. - OpenSSL versions prior to 1.0.1n and 1.0.2 prior to 1.0.2b.
Vulnerability Insight Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.
Vulnerability Detection Method Checks previous collected cipher suites. Details: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam) OID:1.3.6.1.4.1.25623.1.0.805188 Version used: 2025-03-27T05:38:50Z

2.1.29 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary

The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

It was detected that the host implements RFC1323/RFC7323.

The following timestamps were retrieved with a delay of 1 seconds in-between:

Packet 1: 295809

Packet 2: 295919

Impact

A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:

Solution type: Mitigation

To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.

To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'

... continues on next page ...

...continued from previous page ...
Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP Timestamps Information Disclosure OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2023-12-15T16:10:08Z
